

Final Distribution After Selenium

The Data Science group wanted to add a final distribution chart. This was the combination of the highway datasets, the van dataset, the bus dataset, the big truck dataset, and the dump truck/construction dataset. We see we exceeded the 1500 count goal for semi truck, box truck and pickup truck. We were at around 1300-1400 for van and construction, and we were a little low on bus, dump truck, and tow truck. We would likely need another bus dataset. It seemed like the first was one a bit too noisy to get the results we wanted. We could do a similar thing for dump trucks and tow trucks, because our selenium queries were never focused on them. Even in the dump truck/construction dataset, we only queried construction (the original goal). We just ended up getting a lot of dump trucks.
